# Magnetic Paint (acrylic-based)

## Magnetic board effect

can be applied as a metal coating to all substrates

With the magnetic paint you can coat surfaces such as paper, wood, plastic, etc. with a metal layer to obtain a magnetic board effect. Enough to cover about 1 m<sup>2</sup>.

### Application:

The substrate must be clean, dry and free of grease.

Apply at least three coats. The individual layers should be applied crosswise. The drying time between coats is approx. two hours.

After applying the last coat, the magnetic paint must be left to dry and harden for 24 hours. After this time, magnets will adhere to the surface.

Once hardened, the magnetic paint is waterproof and can be painted over with commercially available paints. If left blank, it cannot be written on with chalk.

Contains chloromethylisothiazolinones, methylisothiazolinones and DMDMH. May cause allergic reactions.
